Android platform architect (100M+ users, 99.9% uptime) | On-device + agentic AI | Kotlin / KMP | Open to Staff / Principal

SUMMARY

14 years shipping Android platforms used by 100M+ people. Owned HLD for Verizon Cloud sync at Synchronoss: 99.9% uptime target, ~70% technical-debt cut, measurable ANR drop via freeze/memory alerts. Applying the same constraints (latency, privacy, battery, failure recovery) to on-device Gemma and agent triage -- with live demos, not slideware.

SYNCHRONOSS TECHNOLOGY -- SENIOR SOFTWARE ENGINEER III (2020-PRESENT)

Verizon Cloud (Play: Media Manager / Verizon Cloud)

- Architected HLD and data contracts for core cloud sync so 100M+ users could backup and fetch media at a 99.9% uptime target.
- Replaced legacy subsystems and cut ~70% of technical debt, with a measurable ANR decrease once freeze/memory alerts fired before users felt them.
- Diagnosed production ANRs, leaks, and concurrency bugs on critical paths; treated reliability as an observed metric.
- Set MVVM/MVI + KMP patterns, schemas, and tech stack for the Android team; turned stakeholder roadmaps into shippable milestones.

APPLIED AI (PROTOTYPES -- MEASURED, NOT PRODUCTION CLAIMS)

- ANR Triage Agent (live): paste a log, get a class + next probe. 10/10 labeled fixture traces; median triage <50 ms in-browser.
- AiStudyHub eval gallery (live): worksheet -> walkthrough. 8 labeled sheets; 6/8 read-the-problem (75%); fail cases documented.
- On-device AI budget (live): RAM / tokens / thermal before shipping Gemma or Gemini Nano. 12 device x model rows published.
- adk-samples and android/ai-samples on my GitHub are study forks, not products I shipped.

EARLIER ROLES

- Senior Consultant, Xebia (2019-2020) -- Android architecture for consulting deliveries.
- Android Team Lead, Wipro (2018-2019) -- led an Android delivery team.
- Senior Software Engineer, Source Soft Solutions (2017-2018); Prospus Consulting (2015-2017).
- Software Engineer, Xantatech (2012-2015) -- first 3 years of Android production.

SKILLS

Kotlin, Jetpack Compose, KMP, Coroutines/Flow, MVVM/MVI, Jetpack, ANR/memory, observability, TDD (JUnit, Espresso).
Applied AI: Gemma, Gemini APIs, Google ADK (study), eval harnesses, on-device budgets.
